1.0 IDENTIFICATION OF AUTHOR AND DATE OF BEA COMPLETION

Mr. Trevor I. Woollatt assumes the primary responsibility for the data assembly, interpretation, and technical conclusions for the attached BEA. Mr. Woollatt's current resume is provided as Attachment 9.1.

This BEA was conducted on January 6, 2004.

The completion date of this BEA was April 6, 2004.

Trevor I. Woollatt

Associate III

Date

2.0 INTRODUCTION

Applied Science & Technology, Inc. (ASTI) was retained by the City of Rochester Hills on behalf of REI Brownstown LLC (REI) to submit a Petition for a Baseline Environmental Assessment (BEA) determination for a 78-acre parcel of property located at 2801 West Hamlin Road, Rochester Hills, Oakland County, Michigan (Property). The Property is located in an area of residential and commercial development. The Property is currently developed with outdoor recreational facilities including 8 softball diamonds and a golf driving range. The Property was historically used as a landfill.

ASTI reviewed historic documents obtained from the City of Rochester Hills and the DEQ in regard to the Property. The documents were provided by REI and were obtained as part of their site evaluation. The documentation indicates that landfill operations on the Property were conducted primarily by two former owners. The central portion of the Property was known as the Veteran's landfill and was operated by Veteran's Disposal Service, Inc. until March 1, 1973, at which time Veteran's Disposal Service was bought out by Cardinal Land Company. Cardinal Land Company, operated by Browning Ferris Industries (BFI), continued to conduct landfill activities on the Property, primarily in three cells constructed along Hamlin Road, until the fall of 1977. The cells were located on the northeast, north central, and northwest portions on the Property and were designated as Areas A, B, and C, respectively.

REI provided ASTI was with a topographic map indicating the pre-landfill topography elevations, the bottom elevations as indicated in the permit application for Areas A, B, and C, and the current topography. Based on this information, the estimated depth of fill material was calculated in order to both minimize the number of split spoon samples that would be advanced in the fill material and to ensure that the liner of the cells was not penetrated.

ASTI conducted a Phase I Environmental Site Assessment (ESA) that included the Property. Additional information regarding the Property history and adjoining properties can be found in the Phase I ESA, which is included as Attachment 9.2. The Phase I ESA findings identified the Property on two State database lists.

Inactive Solid Waste Facilities

One Inactive Solid Waste Facility (HIST LF) site was identified. This database contains historical information and is no longer updated. This site is the Cardinal Landfill Corporation site located at 2571 West Hamlin Road. This is part of the Property and is the address associated with the former operation.

Delisted List of Contaminated Sites

One Delisted Contaminated Site (DEL SHWS) was identified. This database contains sites that have been delisted or deleted from the List of Contaminated Sites. This site is the Cardinal Landfill Corporation site located at 2571 West Hamlin Road. This is part of the Property and is the address associated with the former operation.

REI Brownstown LLC intends to purchase the Property on April 30, 2004. The future intended use of the Property includes a parking lot, office space, and commercial business development. This BEA is a Category N, based on Minimum Technical Standards for Baseline Environmental Assessments conducted under Section 20126(8) of 1994 PA 451, as amended, issued by the Michigan Department of Environmental Quality (DEQ), dated March 11, 1999.

3.0 PROPERTY DESCRIPTION & INTENDED HAZARDOUS SUBSTANCE/LAND USE

The Property is located on the south side of West Hamlin Road in the City of Rochester Hills in Section 29 of T.3N.-R.11E., and is addressed as 2801 West Hamlin Road, Rochester Hills, Oakland County, Michigan 48326. The location of the Property is shown in Figure 1. The Property is comprised of approximately 78 acres of land and has been assigned Parcel No. 70-15-29-151-012.

The Property is currently occupied by Suburban Softball, a recreational facility with 8 softball diamonds and a golf driving range. There are some structures including dugouts, sheds, garages, and an office trailer on the Property. Photographs of the Property taken on January 18, 2004, by Mr. Steve Guyot, an ASTI geologist, are included as Attachment 9.3. Additional photographs taken on January 28, 2004 are included in Appendix F of the Phase I ESA included as Attachment 9.2.

Land use adjoining the Property is listed below.

| | |
|-------|---|
| North | West Hamlin Road and beyond is vacant land known as the Christianson Landfill |
| South | Rails to Trails - former Grand Trunk Railway grade and beyond is Ajax paving concrete plant and storage yards. Trans line |
| East | Residential |
| West | Vacant land |

The Property is zoned ORT, Office-Research-Technology. Zoning information was obtained from the City of Rochester Hills zoning map. Site utilities include sanitary and storm sewer services provided by the City of Rochester Hills. Municipal water supply is available through the City of Rochester Hills. DTE Energy and Consumers Energy provide electric and natural gas services to the Property, respectively.

Intended use of the Property is parking lot, office space, and commercial business development with no hazardous substance use intended.

4.0 KNOWN CONTAMINATION

A soil and groundwater investigation was conducted based on the historic use of the Property as a landfill.

The purpose of this investigation was to determine if 1) the Property's soil had been impacted, and, if impacts were found, to determine if the Property is a facility as defined in Part 201 of Michigan's *Natural Resources and Environmental Protection Act, 1994 PA 451, as Amended* (Part 201) and 2) to determine groundwater depth, flow direction, and whether or not groundwater is impacted and if any off-site migration of contamination exists. To determine whether or not the Property has been impacted, analytical results were compared to Generic Residential Cleanup Criteria (GRCC) for soil and groundwater as published by Michigan's Department of Environmental Quality (DEQ) in the tables *Part 201 Generic Cleanup Criteria and Screening Levels, Natural Resources and Environmental Protection Act, 1994 PA 451, as Amended* (OM18).

During the period December 16 through 19, 2003, Mr. Trevor Woollatt, a Hydrogeologist in ASTI's Property Services Group, supervised the installation of thirteen soil borings (SB-1 through SB-13) on the Property and in the right of way immediately to the north and south of the Property.

Soil borings SB-1 through SB-4 were located north of the Property along West Hamlin Road in the City of Rochester Hills right of way, and SB-5 through SB-8 were located south of the Property along the former railroad grade in property currently owned by the City of Rochester Hills. Soil borings SB-1 through SB-8 were completed as permanent groundwater monitor wells MW-1 through MW-8, respectively. Soil borings SB-9 and SB-10 were located in the Veteran's Landfill portion of the Property, and borings SB-11, SB-12, and SB-13 were located in the BFI operated Cardinal Landfill Areas A, B, and C, respectively. As described in Section 2.0 of this report, the bottom elevation of each cell was estimated based on the design elevations indicated in the permits and the current topography. These borings were advanced with minimal split spoon sampling until approximately 5' above the bottom of fill and then the borings were continuously split spooned. This methodology was employed based on the difficulty in split spooning in landfill material and to ensure that the liner was not penetrated. The boreholes were abandoned with a bentonite slurry immediately upon

completion. Figure 2 depicts the Property and the soil boring and monitor well locations. Soil boring logs are included as Attachment 9.4.

The monitor wells were installed in the right of ways because the access agreement between REI (the purchaser) and the seller did not allow for permanent monitor wells to be installed. REI anticipates that continued groundwater monitoring will be required for due care and locating the monitor wells in the right of way was both cost effective and ensures that the monitor wells will remain undisturbed during site redevelopment.

The monitor wells were constructed of 2" diameter PVC using 10' screens and solid risers and were finished with 8" diameter flush-mounted traffic rated covers set in concrete pads. The soil borings were installed using 4.25-inch hollow stem augers. The monitor wells were set so as to be partially penetrating the groundwater surface. The annulus space was backfilled with filter sand from the bottom of the screen to 2' above the screen and from the filter sand to 1' below ground surface (bgs) with a bentonite slurry. The borings located in the landfill material (SB-9 through SB-13) were filled with a bentonite slurry immediately upon completion of the borings. All auger cuttings, decontamination water, well development water, and the plastic lining used to construct the decontamination containment area were containerized in DOT approved 55-gallon drums that were labeled non-hazardous and staged on the asphalt-paved parking area by the office trailer on-site pending disposal. A total of eighteen 55-gallon drums of auger cuttings, three 55-gallon drums of monitor well development water, and three 55-gallon drums of decontamination water and wash liner are staged on-site.

From March 2 through 4, 2004, an additional 20 soil borings (SB-14 through SB-33) were advanced through the landfill material. The borings were located along the interior limit of the proposed excavation limits. The purpose of these borings was to determine the depth of fill along this boundary in order to design a leachate collection system and further refine landfill material volume estimates. Samples of the fill material were collected for analysis. Seven of the borings (SB-16 through SB-22) were located in the eastern portion of the Veteran's landfill, five borings (SB-23 through SB-27) were located in the western portion of the Veteran's landfill. Borings SB-14, SB-15, and SB-28 through SB-33 were installed in the Cardinal Landfill. Soil boring logs are included as Attachment 9.4.

All borings with the exception of SB-18 and SB-20 were completed as gas vents. The vents were constructed of 2" diameter PVC screen from the bottom of boring to approximately 10' bgs and 2" diameter solid PVC riser to approximately 3-4 feet above ground surface. The vents were capped using expandable well caps to prevent exposure to landfill gasses. The screened intervals were backfilled with washed peastone in order to enhance gas recovery and backfilled with bentonite from the screened interval to ground surface.

Soil and Groundwater Sample Collection Procedures

Soil encountered during field activities was identified by ASTI's staff, examined for visual and/or olfactory evidence of impact and recorded in a field logbook. All downhole equipment was decontaminated using a heated power-washer with an Alconox® wash and clean water rinse between borings to minimize the risk of cross contamination of samples. The split spoon sample equipment was decontaminated between borings using an Alconox® wash and clean water rinse.

Prior to sampling, the monitor wells were gauged for static water level and purged of a minimum of three casing volumes of water. The water level meter was decontaminated using an Alconox® wash and clean water rinse before gauging and after each monitor well to minimize the risk of cross contamination. Samples were collected using disposable bailers, pressure bailers, and bailer cord to minimize the risk of cross contamination. The pressure bailers are used to filter groundwater for analysis of dissolved metals.

One soil and one groundwater sample was collected from SB-1/MW-1 through SB-8/MW-8, and two soil samples were collected from SB-9 through SB-13, with the exception of SB-11, from which only one soil sample was obtained. A total of 25 samples were collected from borings (SB-14 through SB-33). All soil and groundwater samples were collected into laboratory certified clean sample containers, cooled to 4°C, and submitted to Brighton Analytical L.L.C. under standard chain-of-custody procedures for analysis of volatile organic compounds (VOCs) by US EPA Method SW846 8260, semi-volatile organic compounds (SVOCs) by US EPA Method SW846 8270, polychlorinated biphenyls (PCBs) by US EPA Method SW846 8082, and the 10 Michigan metals – arsenic, barium, cadmium, chromium, copper, lead, mercury, selenium silver, and zinc (Metals) by US EPA Methods SW846 6020 and 7471. Samples submitted for soil VOC analysis were preserved in the field with methanol per US EPA Method 5035. Samples submitted for dissolved Metals analysis were filtered in the field using disposable 0.45 micron filters.

Soil and Groundwater Characteristics

The topography of the Property, due to the former use as a landfill and the geologic setting, declines steeply on all sides except the northwest. The general elevation of the central (Veteran's Landfill) portion is approximately 860'. The Property survey data were collected by Midwestern Consulting (MCI), who used benchmarks established by the City of Rochester Hills. The Property declines to approximately 800' at the northeast corner. The southern Property line adjoining the former railroad grade trends from approximately 836' at the southwest corner to 818' at the southeast corner.

The soil profile encountered along the north side of the Property from SB-1/MW-1 at the west end to SB-4/MW-4 at the east end consists of approximately 5' of brown clay underlain by approximately 10' of brown sand. This sand is underlain by brown clay that grades to blue/grey clay with lenses of very fine grey sandy silt. The blue clay is underlain by a medium to coarse grained quartz sand that is saturated. The bottom of the grey silt is also saturated. As the topography declines to the east, the upper clay and sand pinch out. In addition, by the SB-3/MW-3 location the blue clay and the silt are found to be thinning and pinching out and these strata are not evident at the SB-4/MW-4 location.

The soil profile encountered along the south side of the Property from SB-8/MW-8 at the west end to SB-5/MW-5 at the east end consists of approximately 15' of brown sand with occasional grey sand silt lenses that pinch out to the east and are not found in SB-5/MW-5.

The soil profile on the Property varied due to the nature of the fill material and the thickness of the overburden or cap. At SB-9 and SB-10, in the Veteran's Landfill area, the cap consisted of a sandy clay that was approximately 2' to 3' in thickness. At these locations, the fill was about 40' in thickness and was found to extend to an approximate elevation of 822'. In SB-9, the fill terminated in a dry, coarse to medium grained sand, and in SB-10, the fill terminated in a dry blue clay with evidence of dry coarse sand.

Soil borings SB-11, SB-12, and SB-13 were advanced in the Areas A, B, and C, respectively, of the BFI operated Cardinal Landfill. The soil profile encountered at SB-11, SB-12, and SB-13 consisted of between 6' and 8' of brown to grey, silty-clay cap material underlain by landfill material to an approximate elevation of 828', 809', and 809', respectively. The fill material terminated in a damp grey sandy silt. The SB-11 (Area A) location was saturated from approximately 836' in the fill material to 828' at the sandy silt. The saturated soil

prevented the collection of a bottom sample from this boring. The soil boring logs included as Attachment 9.4 include the surface elevation at each boring location.

Borings SB-16 through SB-22 on the east side of Veteran's Landfill terminate in native material that varies from grey silty fine grained sand to saturated grey medium grained sand with pebbles. The bottom of fill appears to be dependent on the groundwater elevation at the time aggregate material was removed prior to landfilling. The remainder of the borings in Veteran's and Cardinal Landfills appear to terminate in a native grey silt with varying amounts of fine sand.

Groundwater flow has been determined based on the elevation data collected from the monitor wells and presented on the boring logs. Groundwater flow is to the northeast toward wetlands and the Clinton River at a gradient of 0.02 ft/ft. The groundwater appears to occur at the same elevation as the wetland unit, therefore, it is likely that some portion of the groundwater discharges to the surface at this point. Figure 2 presents the monitor well locations, groundwater elevation, and groundwater flow direction. The soil boring logs included as Attachment 9.4 include the gauging data collected, top of casing elevation, and groundwater elevation.

Applicable Generic Residential Cleanup Criteria

Based on the lithology, the presence of groundwater, and nearby surface water bodies (wetlands and the Clinton River), the applicable Generic Residential Cleanup Criteria (GRCC) for soil are the drinking water protection (DWP) criteria, the groundwater surface water interface protection (GSIP) criteria, the soil volatilization to indoor air inhalation (SVIAI) criteria, and the direct contact (DC) criteria. The applicable GRCC for groundwater are the residential and commercial I drinking water (DW) criteria, the groundwater surface water interface (GSI) criteria, the residential and commercial I groundwater volatilization to indoor air inhalation (GVIAI) criteria, and the groundwater contact (GC) criteria.

Soil Results

The following is a presentation of the laboratory analytical results for chemicals that exceed the applicable GRCC. Table 1 presents the results for soil samples analyzed in comparison to the GRCC and includes the chemical abstract service number (CAS#) for each chemical. The laboratory analytical reports are included as Attachment 9.5.

PCBs

PCBs were detected in six samples submitted for analysis, however, only SB-25 (22') at 10,000 µg/Kg exceeds the DC criterion of 4,000 µg/Kg. All detections of PCBs were in samples collected from the Veteran's Landfill area.

Metals

Arsenic was detected in SB-10 (24') at 9,800 µg/Kg, SB-11 (18') at 13,000 µg/Kg, SB-13 (27.5-29.5') at 16,000 µg/Kg, SB-14 (24-26') at 20,000 µg/Kg, SB-15 (20') at 9,400 µg/Kg, SB-21 (18') at 8,300 µg/Kg, SB-21 (21-23') at 10,000 µg/Kg, SB-22 (26') at 15,000 µg/Kg, SB-24 (24') at 9,900 µg/Kg, SB-25 (22') at 9,400 µg/Kg, and SB-29 (30') at 14,000 µg/Kg,. These concentrations exceed the DC criterion of 7,600 µg/Kg.

Cadmium was detected in SB-22 (26) at 10,000 µg/Kg, SB-25 (22') at 13,000 µg/Kg, and SB-29 (30') at 9,000 µg/Kg. These concentrations exceed the DWP criterion of 6,000 µg/Kg.

Chromium was detected in all soil samples in excess of the GSIP criterion of 3,300 µg/Kg, however, only those values that exceed the Statewide Default Background Level (SDBL) of 18,000 µg/Kg are presented. Chromium was detected in SB-9 (28') at 33,000 µg/Kg, SB-10 (24') at 36,000 µg/Kg, SB-11 (18') at 20,000 µg/Kg, SB-12 (20') at 140,000 µg/Kg, SB-14 (24-24') at 23,000 µg/Kg, SB-15 (20') at 37,000 µg/Kg, SB-16 (20') at 24,000 µg/Kg, SB-17 (15') at 120,000 µg/Kg, SB-18 (20') at 89,000 µg/Kg, SB-19 (23') at 75,000 µg/Kg, SB-20 (18') at 19,000 µg/Kg, SB-21 (18') at 22,000 µg/Kg, SB-22 (26') at 100,000 µg/Kg, SB-23 (26') at 91,000 µg/Kg, SB-25 (22') at 260,000 µg/Kg, SB-26 (25') at 83,000 µg/Kg, SB-27 (22') at 26,000 µg/Kg, SB-28 (22') at 52,000 µg/Kg, SB-29 (30') at 41,000 µg/Kg, SB-30 (25') at 31,000 µg/Kg, SB-31 (35') at 62,000 µg/Kg, and SB-33 (28') at 110,000 µg/Kg. These concentrations exceed the SDBL of 18,000 µg/Kg and, with the exception of the SB-11 (18'), SB-14 ,16,20,21,27 sample, the DWP criterion of 30,000 µg/Kg.

Lead was detected in SB-10 (24') at 410,000 µg/Kg, SB-21 (21-23') at 720,000 µg/Kg, SB-22 (26') at 780,000 µg/Kg, SB-25 (22') at 1,000,000 µg/Kg, SB-29 (30') at 430,000 µg/Kg, and SB-32 (31-32') at 650,000 µg/Kg. These concentrations exceed the DC criterion of 400,000 µg/Kg. In addition, the concentrations in SB-21 (21-23'), SB-22 (26'), and SB-25 (22') exceed the DWP criterion of 700,000 µg/Kg.

Mercury was detected in SB-10 (24') at 150 µg/Kg, SB-12 (20') at 620 µg/Kg, and SB-13 (18') at 140 µg/Kg, SB-17 (15') at 170 µg/Kg, SB-18 (20') at 310 µg/Kg, SB-19 (40-41') at 140 µg/Kg, SB-20 (18) at 2,400 µg/Kg, SB-21 (18) at 270 µg/Kg, SB-22 (26) at 140 µg/Kg, SB-23 (26') at 130 µg/Kg, SB-25 (22') at 210 µg/Kg, SB-28 (22') at 310 µg/Kg, SB-29 (30') at 270 µg/Kg, SB-31 (35') at 220 µg/Kg, SB-32 (31-32') at 120 µg/Kg, and SB-33 (28') at 120 µg/Kg. These concentrations exceed the GSIP criterion of 100 µg/Kg. In addition, the sample collected from SB-20 (18) exceeds the DWP criterion of 1,700 µg/Kg.

Selenium was detected in SB-1/MW-1 (38.5-40') at 640 µg/Kg, SB-2/MW-2 (33.5-35') at 630 µg/Kg, SB-3/MW-3 (27-27.5') at 810 µg/Kg, SB-5/MW-5 (7-8.5') at 570 µg/Kg, SB-6/MW-6 (7-9') at 410 µg/Kg, SB-7/MW-7 (8.5-10') at 520 µg/Kg, SB-9 (28') at 780 µg/Kg, SB-9 (38.5-40') at 620 µg/Kg, SB-10 (24') at 1,300 µg/Kg, SB-10 (35-37') at 1,200 µg/Kg, SB-11 (18') at 1,300 µg/Kg, SB-13 (18') at 800 µg/Kg, SB-13 (27.5-29.5') at 690 µg/Kg, SB-14 (24-24') at 700 µg/Kg, SB-21 (18) at 580 µg/Kg, SB-22 (26) at 1,200 µg/Kg, SB-23 (26') at 490 µg/Kg, and SB-25 (22') at 2,000 µg/Kg. These concentrations exceed the GSIP criterion of 400 µg/Kg.

Silver was detected in SB-9 (28') at 3,900 µg/Kg, SB-10 (24') at 610 µg/Kg, SB-11 (18') at 1,600 µg/Kg, SB-13 (18') at 600 µg/Kg, SB-17 (15') at 930 µg/Kg, SB-19 (23') at 2,100 µg/Kg, SB-22 (26') at 530 µg/Kg, SB-25 (22') at 940 µg/Kg, SB-27 (22') at 720 µg/Kg, SB-31 (35') at 62,000 µg/Kg, and SB-33 (28') at 110,000 µg/Kg. These concentrations exceed the GSIP criterion of 500 µg/Kg.

Zinc was detected in SB-9 (28') at 2,900,000 µg/Kg, which exceeds the DWP criterion of 2,400,000 µg/Kg.

SVOCs

Acenaphthene was detected in SB-22 (26') at 5,200 µg/Kg, which exceeds the GSIP criterion of 4,400 µg/Kg.

Acenaphthylene was detected in SB-19 (23') at 7,000 µg/Kg, which exceeds the DWP criterion of 5,900 µg/Kg.

Benzo(a)pyrene was detected in SB-9 (28') at 4,500 µg/Kg, SB-19 (23') at 18,000 µg/Kg, SB-22 (26') at 5,300 µg/Kg, SB-25 (22') at 3,500 µg/Kg, SB-29 (30') at 4,100 µg/Kg, and

SB-32 (31-32') at 8,800 µg/Kg. These concentrations exceed the DC criterion of 2,000 µg/Kg.

Butyl benzyl phthalate was detected in SB-15 (20') at 77,000 µg/Kg, which exceeds the GSIP of 26,000 µg/Kg.

Carbazole was detected in SB-9 (28') at 2,200 µg/Kg, SB-19 (23') at 10,000 µg/Kg, SB-22 (26') at 3,200 µg/Kg, SB-25 (22') at 1,700 µg/Kg, SB-29 (30') at 2,600, and SB-32 (31-32') at 4,500 µg/Kg. These concentrations exceed the GSIP criterion of 1,100 µg/Kg. In addition, the concentration detected in SB-19 (23') exceeds the DWP criterion of 9,400 µg/Kg.

Dibenzofuran was detected in SB-9 (28') at 2,000 µg/Kg, SB-19 (23') at 5,600 µg/Kg,, SB-22 (26') at 4,300 µg/Kg, and SB-32 (31-32') at 2,800 µg/Kg. These concentrations exceed the GSIP criterion of 1,700 µg/Kg.

Diethylphthalate was detected in SB-17 (15') at 21,000 µg/Kg, SB-18 (20') at 3,700 µg/Kg, SB-19 (23') at 2,700 µg/Kg, SB-23 (26') at 26,000 µg/Kg, and SB-28 (22') at 2,600 µg/Kg. These concentrations exceed the GSIP criterion of 2,200 µg/Kg.

Fluoranthene was detected in SB-19 (23') at 61,000 µg/Kg, which exceed the GSIP criterion of 55,000 µg/Kg.

Fluorene SB-19 (23') at 8,200 µg/Kg and SB-22 (26') at 7,000 µg/Kg. These concentrations exceed the GSIP criterion of 5,300 µg/Kg.

Naphthalene was detected in SB-9 (28') at 8,100 µg/Kg, SB-10 (24') at 3,600 µg/Kg, SB-12 (20') at 1,400 µg/Kg, SB-17 (15') at 7,300 µg/Kg, SB-18 (20') at 5,300 µg/Kg, SB-19 (23') at 16,000 µg/Kg, SB-22 (26') at 5,100 µg/Kg, SB-23 (26') at 15,000 µg/Kg, SB-25 (22') at 20,000 µg/Kg, SB-29 (30') at 2,300 µg/Kg, and SB-32 (31-32') at 5,700 µg/Kg. These concentrations exceed the GSIP criterion of 870 µg/Kg.

Phenanthrene was detected in SB-9 (28') at 21,000 µg/Kg, SB-19 (23') at 6,400 µg/Kg, SB-22 (26') at 34,000 µg/Kg, SB-25 (22') at 11,000 µg/Kg, SB-29 (30') at 14,000 µg/Kg, and

SB-32 (31-32') at 29,000 µg/Kg. These concentrations exceed the GSIP criterion of 5,300 µg/Kg.

Phenol was detected in SB-17 (15') at 11,000 µg/Kg, SB-18 (20') at 4,700 µg/Kg, SB-22 (26') at 4,700 µg/Kg, SB-28 (22') at 6,200 µg/Kg, and SB-29 (30') at 5,600 µg/Kg. These concentrations exceed the GSIP criterion of 4,200 µg/Kg.

VOCs

Benzene was detected in SB-9 (28') at 2,700 µg/Kg, SB-21 (21-23') at 180 µg/Kg, SB-22 (26') at 130 µg/Kg, SB-24 (24') at 150 µg/Kg, SB-29 (30') at 330 µg/Kg, and SB-32 (31-32') at 120 µg/Kg. These concentrations exceed the DWP criterion of 100 µg/Kg. In addition, the concentration detected in SB-9 (28') exceeds the SVIAI criterion of 1,600 µg/Kg.

Chlorobenzene was detected in SB-26 (25') at 8,700 µg/Kg, which exceeds the GSIP criterion of 940µg/Kg and the DWP criterion of 2,000µg/Kg.

1,4-dichlorobenzene was detected in SB-20 (18') at 2,200 µg/Kg, SB-21 (18') at 1,200 µg/Kg, SB-22 (26') at 320 µg/Kg, SB-26 (25') at 2,900 µg/Kg, SB-27 (22') at 1,100 µg/Kg, SB-28 (22') at 2,100 µg/Kg, and SB-29 (30') at 430 µg/Kg. These concentrations exceed the GSIP criterion of 290 µg/Kg. In addition, the concentrations detected in SB-20 (18'), SB-26 (25'), and SB-28 (22') exceed the DWP criterion of 1,700 µg/Kg.

Ethylbenzene was detected in SB-9 (28') at 15,000 µg/Kg, SB-10 (24') at 2,000 µg/Kg, SB-10 (35-37') at 400 µg/Kg, SB-12 (20') at 1,700 µg/Kg, SB-13 (18') at 870 µg/Kg, SB-17 (15') at 2,200 µg/Kg, SB-18 (20') at 4,100 µg/Kg, SB-19 at (23') 4,300 µg/Kg, SB-20 (18') at 1,100 µg/Kg, SB-21 (18') at 650 µg/Kg, SB-22 (26') at 1,200 µg/Kg, SB-23 (26') at 220,000 µg/Kg, SB-24 (24') at 710 µg/Kg, SB-25 (22') at 43,000 µg/Kg, SB-26 (25') at 3,100 µg/Kg, SB-27 (22') at 2,500 µg/Kg, SB-28 (22') at 1,700 µg/Kg, SB-29 (30') at 7,200 µg/Kg, SB-30 (25') at 1,700 µg/Kg, SB-31 (35') at 860 µg/Kg, SB-32 (31-32') at 1,100 µg/Kg, and SB-33 (28') 1,900 µg/Kg. These concentrations exceed the GSIP criterion of 370 µg/Kg, and SB-9 (28'), SB-10 (24'), SB-12 (20'), SB-17 (15'), SB-18 (20'), SB-19 at (23'), SB-23 (26'), SB-25 (22'), SB-26 (25'), SB-27 (22'), SB-28 (22'), SB-29 (30'), SB-30 (25'), and SB-33 (28') exceed the DWP criterion of 1,500 µg/Kg. The concentration detected in SB-23 (26') exceeds the SVIAI criterion of 87,000 µg/Kg and the DC criterion of 140,000 µg/Kg.

Naphthalene was detected in SB-9 (28') at 8,200 µg/Kg, SB-10 (24') at 3,600 µg/Kg, SB-12 (20') at 11,000 µg/Kg, SB-14 (24-26') at 1,300 µg/Kg, SB-16 (20') at 930 µg/Kg, SB-17 (15') at 9,500 µg/Kg, SB-18 (20') at 5,800 µg/Kg, SB-19 (23') at 20,000 µg/Kg, SB-21 (18') at 1,900 µg/Kg, SB-22 (26') at 4,400 µg/Kg, SB-23 (26') at 31,000 µg/Kg, SB-24 (24') at 1,300 µg/Kg, SB-27 (22') at 950 µg/Kg, SB-28 (22') at 950 µg/Kg, SB-29 (30') at 1,600 µg/Kg, SB-32 (31-32') at 7,900 µg/Kg, and SB-33 (28') at 1,700 µg/Kg. These concentrations exceed the GSIP criterion of 870 µg/Kg. The difference in the concentrations detected in the VOC analysis versus the SVOC analysis is due to the analytical method used.

n-Butylbenzene was detected in SB-19 (23') at 2,000 µg/Kg, SB-23 (26') at 22,000 µg/Kg, and SB-25 (22') at 8,900 µg/Kg. These concentrations exceed the DWP criterion of 1,600 µg/Kg.

n-Propylbenzene was detected in SB-23 (26') at 70,000 µg/Kg and SB-25 (22') at 10,000 µg/Kg. These concentrations exceed the DWP criterion of 1,600 µg/Kg.

Tetrachloroethene was detected in SB-10 (24') at 1,500 µg/Kg, SB-11 (35-37') at 300 µg/Kg, SB-18 (20') at 3,500 µg/Kg, SB-19 (23') at 120 µg/Kg, SB-21 (18') at 110 µg/Kg, SB-22 (26') at 150 µg/Kg, SB-23 (26') at 16,000 µg/Kg, SB-27 (22') at 3,900 µg/Kg, SB-28 (22') at 2,100 µg/Kg, and SB-33 (28') at 230 µg/Kg. These concentrations exceed the DWP criterion of 100 µg/Kg. The concentrations detected in SB-10 (24'), SB-18 (20'), SB-23 (26'), SB-27 (22'), and SB-28 (22') exceed the GSIP criterion of 900 µg/Kg. In addition, the concentration detected in the SB-23 (26') exceeds the SVIAI criterion of 11,000 µg/Kg.

Toluene was detected in SB-9 (28') at 24,000 µg/Kg, SB-18 (20') at 10,000 µg/Kg, SB-23 (26') at 750,000 µg/Kg, SB-25 (22') at 180,000 µg/Kg, SB-27 (22') at 6,800 µg/Kg, SB-28 (22') at 4,700 µg/Kg, and SB-29 (30') at 14,000 µg/Kg. These concentrations exceed the GSIP criterion of 2,800 µg/Kg. The concentrations detected in SB-9 (28'), SB-23 (26'), and SB-25 (22') exceed the DWP criterion of 16,000 µg/Kg. In addition, the concentration detected in SB-23 (26') exceeds the SVIAI and DC criteria of 250,000 µg/Kg and 250,000 µg/Kg, respectively.

Trichloroethene was detected in SB-18 (20') at 450 µg/Kg, SB-23 (26') at 11,000 µg/Kg, SB-27 (22') at 1,100 µg/Kg, SB-28 (22') at 940 µg/Kg, SB-29 (30') at 290 µg/Kg, and SB-33 (28') at 490 µg/Kg. These concentrations exceed the DWP criterion of 100 µg/Kg. The concentration detected in SB-23 (26') exceeds the GSIP and SVIAI criteria of 4,000 µg/Kg and 7,100 µg/Kg, respectively.

1,2,4-trimethylbenzene was detected in SB-9 (28') at 5,500 µg/Kg, SB-10 (24') at 8,800 µg/Kg, SB-12 (20') at 3,100 µg/Kg, SB-13 (18') at 2,900 µg/Kg, SB-14 (24-26') at 2,200 µg/Kg, SB-15 (20') at 5,200 µg/Kg, SB-16 (20') at 2,700 µg/Kg, SB-17 (15') at 5,800 µg/Kg, SB-18 (20') at 4,500 µg/Kg, SB-19 (23') at 11,000 µg/Kg, SB-20 (18') at 1,900 µg/Kg, SB-21 (18') at 2,300 µg/Kg, SB-22 (26') at 2,000 µg/Kg, SB-23 (26') at 210,000 µg/Kg, SB-24 (24') at 3,600 µg/Kg, SB-25 (22') at 58,000 µg/Kg, SB-26 (25') at 1,600 µg/Kg, SB-27 (22') at 1,900 µg/Kg, SB-28 (22') at 4,100 µg/Kg, SB-29 (30') at 2,700 µg/Kg, SB-30 (25') at 1,300 µg/Kg, SB-32 (31-32') at 2,400 µg/Kg, and SB-33 (28') 2,400 µg/Kg. These concentrations exceed the GSIP criterion of 570 µg/Kg. The concentrations detected in SB-9 (28'), SB-10 (24'), SB-12 (20'), SB-13 (18'), SB-14 (24-26'), SB-15 (20'), SB-16 (20'), SB-17 (15'), SB-18 (20'), SB-19 (23'), SB-21 (18'), SB-23 (26'), SB-24 (24'), SB-25 (22'), SB-28 (22'), SB-29 (30'), SB-32 (31-32'), and SB-33 (28') exceed the DWP criterion of 2,100 µg/Kg. In addition, the concentration detected in SB-23 (26') exceeds the SVIAI and DC criteria of 110,000 µg/Kg and 110,000 µg/Kg, respectively.

1,3,5-trimethylbenzene was detected in SB-9 (28') at 1,400 µg/Kg, SB-10 (24') at 1,600 µg/Kg, SB-15 (20') at 1,600 µg/Kg, SB-17 (15') at 2,300 µg/Kg, SB-18 (20') at 1,900 µg/Kg, SB-19 (23') at 2,800 µg/Kg, SB-23 (26') at 90,000 µg/Kg, SB-25 (22') at 15,000 µg/Kg, and SB-28 (22') at 1,300 µg/Kg. These concentrations exceed the GSIP criterion of 1,100 µg/Kg. The concentrations detected SB-17 (15'), SB-18 (20'), SB-19 (23'), SB-23 (26'), and SB-25 (22') exceed the DWP criterion of 1,800 µg/Kg.

Xylenes were detected in SB-9 (28') at 37,000 µg/Kg, SB-10 (24') at 7,400 µg/Kg, SB-10 (35-37') at 1,600 µg/Kg, SB-11 (18') at 1,400 µg/Kg, SB-12 (20') at 7,300 µg/Kg, SB-12 (37-39') at 710 µg/Kg, SB-13 (18') at 1,900 µg/Kg, SB-13 (27.5-29.5') at 5,300 µg/Kg, SB-14 (24-26') at 3,600 µg/Kg, SB-15 (20') at 890 µg/Kg, SB-16 (20') at 4,900 µg/Kg, SB-17 (15') at 15,000 µg/Kg, SB-18 (20') at 21,000 µg/Kg, SB-19 (23') at 37,000 µg/Kg, SB-20 (18') at 5,300 µg/Kg, SB-20 (20-21') at 1,300 µg/Kg, SB-21 (18') at 4,100 µg/Kg, SB-22 (26') at 6,600 µg/Kg, SB-23 (26') at 1,000,000 µg/Kg, SB-24 (24') at 9,200 µg/Kg, SB-25 (22') at 230,000 µg/Kg, SB-26 (25') at 25,000 µg/Kg, SB-27 (22') at 12,000 µg/Kg, SB-28 (22') at 6,300 µg/Kg, SB-29 (30') at 25,000 µg/Kg, SB-30 (31') at 880 µg/Kg, SB-31 (35') at 4,100 µg/Kg, SB-32 (31-32') at 4,300 µg/Kg, and SB-33 (28') at 8,400 µg/Kg. These concentrations exceed the GSIP criterion of 700 µg/Kg. The concentrations detected in SB-9 (28'), SB-10 (24'), SB-12 (20'), SB-17 (15'), SB-18 (20'), SB-19 (23'), SB-22 (26'), SB-23

(26'), SB-24 (24'), SB-25 (22'), SB-26 (25'), SB-27 (22'), SB-28 (22'), SB-29 (30'), and SB-33 (28') exceed the DWP criterion of 5,600 µg/Kg. In addition, the concentrations detected in SB-23 (26') and SB-25 (22') exceed the SVIAI and DC criteria of 150,000 µg/Kg and 150,000 µg/Kg, respectively.

Groundwater Results

The following is a presentation of the laboratory analytical results for chemicals that exceed the applicable GRCC. Table 2 presents the results for groundwater samples analyzed in comparison to the GRCC and includes the chemical abstract service number (CAS#) for each chemical. The laboratory analytical reports are included as Attachment 9.5.

PCBs

There were no PCBs detected at or above the method detection limit in any sample analyzed.

Metals

Lead was detected in MW-2 at 8 µg/L, MW-4 at 41 µg/L, MW-7 at 13 µg/L, and MW-4 at 11 µg/L. These concentrations exceed the DW criterion of 4 µg/L. In addition, the concentration in MW-4 exceeds the GSI criterion for surface water that is used as a drinking water source or is in connection with the Great Lakes.

Naphthalene was detected in MW-2 at 25 µg/L, which exceeds the GSI criterion of 13 µg/L.

Other Media

Air samples were collected from the vents installed in borings SB-15, SB-21, and SB-30. The samples were collected into Tedlar bags and transported under standard chain of custody to RTI Laboratories, Inc. in Livonia for analysis of VOCs by EPA Method TO-15. The air sample results indicate that benzene, carbon disulfide, chlorobenzene, chloroethane, chloroform, cis-1,2-dichloroethene, 1,1,-dichloroethane, 1,1-dichloroethene, ethylbenzene, methylene chloride, styrene, tetrachloroethene, toluene, trans-1,2-dichloroethene, 1,1,1-trichloroethane, 1,1,2-trichloroethane, 1,1,2-trichlorotrifluoroethane, trimethylbenzene isomers, vinyl chloride, and xylenes were detected in one or more of the three samples. ASTI is currently in discussions with the DEQ Remediation and Redevelopment Division (RRD) and Air Quality Division (AQD) to determine exposure risks and possible due care obligations in regard to these VOCs. Table 3 presents the air sample results in comparison to

the AQD Initial Toxic Screening Levels (ITSLs). The laboratory analytical reports are included as Attachment 9.5

ASTI monitored methane in the augers and ambient air during drilling activities. The augers were screened at 5' intervals. Methane was detected in SB-9 through SB-33. The methane concentrations were 100% of the lower explosive limit (LEL) at all sample locations in the augers and < 2% LEL within 1' of the augers. Due to the elevated methane detections, drilling activities were halted regularly to allow the methane to vent. There were no LEL readings beyond 1' from the augers. The LEL meter was calibrated using 50 ppm methane calibration gas. ASTI intended to screen the augers during the SB-9 through SB-13 boring installation using a flame ionization detector (FID) calibrated with 100 ppm methane calibration gas in order to better quantify the methane concentrations, however, due to temperatures below 20° F, the FID was inoperable. Methane was also detected at 100% LEL at the methane vents located around the Property. An FID was used to screen borings SB-14 through SB-33 during installation. FID readings exceed the upper detectable range of 10,000 parts per million, which is equivalent to 1% by volume.

On March 5, 2004, ASTI screened the newly installed vents, the previously installed groundwater monitor wells along Hamlin Road (MW-1 through MW-4) and the Rails to Trails (MW-5 through MW-6), and three vents previously installed by the DEQ on the adjoining residential parcel to the northeast using a Landtec Model GEM-500 landfill gas analyzer capable of detecting methane concentrations from 0% to 100% by volume. Methane was detected at all locations within the landfill at approximately 65% by volume. Table 4 presents the methane screening data collected.

Methane was detected in the groundwater monitor wells located in the north and south adjoining right-of-ways at the following concentrations: MW-1 at 16.90%, MW-2 at 0.60%, MW-3 at 33.40%, MW-6 at 41.20%, and MW-7 0.10%. In addition, methane was detected at 3% in vent located at the center of the southern property line of the northeast adjoining residential parcel. Table 4 presents the methane screening data collected.

Summary

Based on the concentrations of PCBs, arsenic, cadmium, chromium, lead, mercury, selenium, silver, zinc, acenaphthene, acenaphthylene, benzo(a)pyrene, butyl benzyl phthalate, carbazole, dibenzofuran, diethylphthalate, fluoranthene, fluorene, naphthalene, phenanthrene,

phenol, benzene, chlorobenzene, 1,4-dichlorobenzene, ethylbenzene, n-butylbenzene, n-propylbenzene, tetrachloroethene, toluene, trichloroethene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and xylenes in excess of the GRCC for DC, SVIAI, GSIP, and DWP in the Property soil; lead and naphthalene in groundwater in excess of the GRCC for DW and GSI; and methane and other VOCs in the landfill material, the Property meets the definition of a facility as defined in Section 20101(1)(o) of Part 201 of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended.

Based on the groundwater sample results and the methane readings in the off-site groundwater monitor wells and vents, it appears that impact is migrating off the Property above the GRCC. REI Brownstown LLC will file a Notice of Migration of Contamination Form upon taking ownership of the Property.

Due to the nature of landfills, it is possible that chemicals not listed in this BEA may be identified during the course of site redevelopment activities. In the event that other chemicals are identified, the DEQ will be notified as post BEA information.

5.0 LIKELIHOOD OF OTHER CONTAMINATION

A copy of the EDR report is included in Appendix G of the Phase I ESA included as Attachment 9.2. There is no reason to suspect that any additional hazardous substances, other than those discussed in Section 4.0 (Known Contamination) of this report, would be present on the Property.

6.0 ALTERNATIVE APPROACHES

Based on the Instructions for Preparing and Submitting Baseline Environmental Assessments and 7a Compliance Analysis to the Michigan Department of Environmental Quality and for Requesting Optional Determinations Pursuant to 1994 PA 451, Part 201, as amended, March 11, 1999, a Category N BEA does not require specific contaminant distribution and extent. No alternative approaches are required.

7.0 CONCLUSIONS

After reviewing all available data, ASTI makes the following conclusions regarding the Property:

- No abandoned aboveground storage tanks, or abandoned or discarded barrels, containers, or other receptacles containing hazardous substances are known to be present on the Property. Based on conversations with Mr. Ben Matthews of the DEQ, the 55-gallon drums used to containerize auger cuttings and decon and purge water are not considered to be abandoned containers.
- The soil profile encountered along the north side of the Property from SB-1/MW-1 at the west end to SB-4/MW-4 at the east end consists of approximately 5' of brown clay underlain by approximately 10' of brown sand. This sand is underlain by brown clay that grades to blue/grey clay with lenses of very fine grey sandy silt. The blue clay is underlain by a medium to coarse grained quartz sand that is saturated. The bottom of the grey silt is also saturated. As the topography declines to the east, the upper clay and sand pinch out. In addition, by the SB-3/MW-3 location the blue clay and the silt are found to be thinning and pinching out and these strata are not evident at the SB-4/MW-4 location.
- The applicable Generic Residential Cleanup Criteria (GRCC) for soil are the drinking water protection (DWP) criteria, the groundwater surface water interface protection (GSIP) criteria, the soil volatilization to indoor air inhalation (SVIAI) criteria, and the direct contact (DC) criteria. The applicable GRCC for groundwater are the residential and commercial I drinking water (DW) criteria, the groundwater surface water interface (GSI) criteria, the residential and commercial I groundwater volatilization to indoor air inhalation (GVIAI) criteria, and the groundwater contact (GC) criteria.
- Based on the concentrations of PCBs, arsenic, cadmium, chromium, lead, mercury, selenium, silver, zinc, acenaphthene, acenaphthylene, benzo(a)pyrene, butyl benzyl phthalate, carbazole, dibenzofuran, diethylphthalate, fluoranthene, fluorene, naphthalene, phenanthrene, phenol, benzene, chlorobenzene, 1,4-dichlorobenzene, ethylbenzene, n-butylbenzene, n-propylbenzene, tetrachloroethene, toluene, trichloroethene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and xylenes in

excess of the GRCC for DC, SVIAI, GSIP, and DWP in the Property soil; lead and naphthalene in groundwater in excess of the GRCC for DW and GSI; and methane in the landfill material, the Property meets the definition of a facility as defined in Section 20101(1)(o) of Part 201 of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended.

- Based on the groundwater sample results and the methane readings in the off-site groundwater monitor wells and vents, it appears that impact is migrating off the Property above the GRCC. REI Brownstown LLC will file a Notice of Migration of Contamination Form upon taking ownership of the Property.
- Due to the nature of landfills, it is possible that chemicals not listed in this BEA may be identified during the course of site redevelopment activities. In the event that other chemicals are identified, the DEQ will be notified as post BEA information.
- There will be no significant hazardous substance use at the Property and this stipulated condition is the basis for being able to distinguish existing contamination from a new release.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration (Csat) since the calculated risk-based criterion is greater than Csat.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, thereore, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration (C_{sat}) since the calculated risk-based criterion is greater than C_{sat} .

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, thereore, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV-Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration (Csat) since the calculated risk-based criterion is greater than Csat.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, thereore, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration (Csat) since the calculated risk-based criterion is greater than Csat.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, thereore, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration (Csat) since the calculated risk-based criterion is greater than Csat.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, thereore, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV-Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration

(C_{sat}) since the calculated risk-based criterion is greater than C_{sat}.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, thereorefre, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration (Csat) since the calculated risk-based criterion is greater than Csat.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, thereorefre, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV-Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration (Csat) since the calculated risk-based criterion is greater than Csat.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, therefor, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration (Csat) since the calculated risk-based criterion is greater than Csat.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, thereorefre, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration (Csat) since the calculated risk-based criterion is greater than Csat.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, therefore, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration (Csat) since the calculated risk-based criterion is greater than Csat.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, thereore, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV-Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration

(C_{sat}) since the calculated risk-based criterion is greater than C_{sat}.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, thereorefre, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NVL- Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration (C_{sat}) since the calculated risk-based criterion is greater than C_{sat}.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, therefofre, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NA-Not available.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

NLL-Hazardous substance is not likely to leach under most conditions.

C-Value presented is a screening level based on the chemical-specific generic soil saturation concentration

(Csat) since the calculated risk-based criterion is greater than Csat.

D-Calculated criterion exceeds 100%, hence it is reduced to 100% or 1.0E + 9 ppb.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

M-Calculated criterion is below the analytical target detection limit, thereorefre, the criterion defaults to the target detection limit.

T-Refer to toxic substance control act (TSCA), 40 CFR Subpart D & G to determine the applicability of TSCA cleanup standards.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown in the generic cleanup criteria table is not protective for surface water that is used as a drinking water source.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

A-Criterion is the State of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399.

E-Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the act.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

L-Criteria for lead are derived using a biologically based model, as allowed under Section 20120a(10) of the act.

M-Calculated criterion is below the analytical target detection limit, therefor, the criterion defaults to the target detection limit.

S-Criterion defaults to the hazardous substance-specific water solubility limit.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown is the value associated with a surface water used as a source of drinking water. This value may be lower depending on the hardness of the surface water body and the risk to aquatic organisms.

AA-Comparison to these criteria may take into account an evaluation of whether the hazardous substances are adsorbed to particulates rather than dissolved in water and whether filtered groundwater samples were used to evaluate groundwater.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

A-Criterion is the State of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399.

E-Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the act.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

L-Criteria for lead are derived using a biologically based model, as allowed under Section 20120a(10) of the act.

M-Calculated criterion is below the analytical target detection limit, therefor, the criterion defaults to the target detection limit.

S-Criterion defaults to the hazardous substance-specific water solubility limit.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown is the value associated with a surface water used for drinking water. This value may be lower depending on the hardness of the surface water body and the risk to aquifer users.

AA-Comparison to these criteria may take into account an evaluation of whether the hazardous substances are adsorbed to particulates rather than dissolved in water and whether filtered groundwater samples were used to evaluate groundwater.

*Per Operational Memorandum #18, Revised December 21, 2002.

ID-Inadequate data to develop criterion.

NLV- Hazardous substance is not likely to volatilize under most soil conditions.

A-Criterion is the State of Michigan drinking water standard established pursuant to Section 5 of 1976 PA 399.

E-Criterion is the aesthetic drinking water value, as required by Section 20120a(5) of the act.

G-Groundwater Surface Water Interface (GSI) criterion depends on the pH or water hardness, or both, of the receiving surface water.

L-Criteria for lead are derived using a biologically based model, as allowed under Section 20120a(10) of the act.

M-Calculated criterion is below the analytical target detection limit, therefor, the criterion defaults to the target detection limit.

S-Criterion defaults to the hazardous substance-specific water solubility limit.

W-Concentrations of trihalomethanes in groundwater shall be added together to determine compliance with the Michigan Drinking Water standard of 100 ug/L.

X-The Groundwater Surface Water Interface (GSI) criterion shown is the value associated with a surface water used of drinking water. This value may be lower depending on the hardness of the surface water body and the risk to aquifer.

AA-Comparison to these criteria may take into account an evaluation of whether the hazardous substances are adsorbed to particulates rather than dissolved in water and whether filtered groundwater samples were used to evaluate groundwater.

Certifications

OSHA 40 hour trained, 8-hour refresher current
DOT 4 hour THM-126 course

Education

West Virginia University, B.S. 1996, Geology
Montgomery College, MD, AA, 1993, General Studies
St. Andrew's University, Scotland, UK, 1990

Experience History

Associate III, Applied Science & Technology, Inc., Brighton, MI
Associate II, Applied Science & Technology, Inc., Brighton, MI
Geologist/Assistant Project Manager, TolTest, Plymouth, MI
Associate Geologist, TolTest, Plymouth, MI

Professional Background

Mr. Woollatt has experience in assigning and coordinating fieldwork. His experience includes both Part 201 and Part 213 regulations and includes the completion of Baseline Environmental Assessments, and Initial Assessment, Final Assessment, Closure, and related reports to the MDEQ. He is experienced in formulating corrective action plans to address soil and groundwater contamination issues on-site and off-site. He is also proficient in soil and groundwater sampling and installation of monitoring wells. Mr. Woollatt also has experience negotiating with government agencies. He has performed Phase II Investigations in MI, OH, NJ, NY and OR.

Years Experience:

4-ASTI
3.5-other firms

HYDROGEOLOGICAL INVESTIGATIONS

Retail Gasoline Stations – 35 Facilities

Assisted in the management of 35 LUST gasoline stations for Clark Refining and Marketing, a major refiner in the midwest. Project management work included site investigations, reports, permitting, and negotiations with government agencies. Activities performed included plume identification, installation of monitoring wells, soil and groundwater sampling, and aquifer testing. Successfully closed fifteen facilities.

Retail Gasoline Stations – 16 Facilities

Assisted in the management of 16 LUST gasoline stations for Mobil Oil Marketing, a major nationwide distributor. Project management work included site investigations, reports, permitting, and negotiations with government agencies. Activities performed included plume identification, installation of monitoring wells, soil and groundwater sampling, and aquifer testing.

Statistical Analysis of Groundwater Data

Developed quarterly reports for a major landfill for submittal to state environmental agency as required by state regulations. Analysis included intra-well comparisons, and evaluation of groundwater quality data in terms of recent land use changes in areas upgradient of landfill. Evaluated groundwater quality in lower regional supply aquifer in terms of natural geochemistry and man-made changes.

Hydrogeological Study, Ypsilanti Hospital

Determined placement of monitor well network through review of Phase I report of property condition of large regional mental health facility. Conducted field work, supervising drilling technicians, to collect soil samples, log lithology, and collect groundwater samples. Reviewed analytical results for soil and groundwater samples and prepared section of final report. Report identified impacted areas needing remediation.

Hydrogeological Study, Automotive Component Manufacturing Facility

Conducted four quarters of groundwater monitoring to demonstrate acceptable groundwater quality. Developed soil sampling plan and off-site groundwater evaluation using profiles and temporary wells. Conducted field work, supervising drilling technicians, to collect soil samples, log lithology, and collect groundwater samples. Reviewed analytical results for soil and groundwater samples and prepared section of final report for site closure.

Analysis of Unconfined Aquifer adjacent to Great Lakes

Reviewed data from monitor wells and staff gauges in creeks and ponds to determine two flow paths in uppermost, unconfined aquifer within ½ mile of Great Lakes. Demonstrated that two paths—surface water discharge and groundwater discharge—are available on 20-acre parcel.

Review of Proposed Golf Course Groundwater Use

Reviewed data from pump test and projected water use to determine suitability and capacity of aquifer to supply domestic and irrigation needs. Reviewed lithology to verify aquifer use did not impact high-quality tributary to Huron River. Presented findings to Township Planning Commission. Summarized findings in report to Planning Commission.

REMEDIATION PROJECTS

Due Care Plan, Part 201 for City of Auburn Hills

Reviewed report of contaminated property to develop a Due Care Plan for construction of enclosed storm drains and reconstruction of Churchill Road. Plan included site monitoring of air

quality for worker safety, contingency procedures for soils requiring evaluation and possible disposal.

Ferrous Chloride Site

Performed system operation and maintenance at a major steel mill to address impact by ferrous chloride to a shallow aquifer.

Heating Fuel Oil Tank Investigation

Conducted site investigation of incompletely remediated heating oil tank installation at manufacturing facility. Work included review of previous earthwork, state agency files, regulatory requirements and on-site investigation. Successfully installed monitor wells in end moraine containing large cobbles, evaluated uppermost aquifer for residual contamination. Distinguished between olfactory evidence and results of chemical testing.

Specification Development, College Powerhouse

Conducted subsurface studies and reviewed property use to determine extent of remediation work. Wrote specifications for bidding by contractors.

Due Care Plan, Part 201 for City of Auburn Hills

Reviewed report of contaminated property to develop a Due Care Plan for construction of Squirrel Road Improvements. Plan addressed property acquired for right-of-way of improvements and included site monitoring of air quality for worker safety, contingency procedures for soils requiring evaluation and possible disposal.

LUST Facility

Performed operation and maintenance for a free product recovery system involving 3 to 4 feet of gasoline in a shallow aquifer.

Landfill Investigation

Performed subsurface geophysical investigation using EM-31 magnetometer to identify likely landfill boundaries. Coordinated test pit activities to verify geophysical investigation and to characterize soil. Developed remediation plan to address relocation of landfill.

Supervised the installation of air sparge remediation system to control off-site migration of gasoline contaminants. Activities included securing off-site access agreements to delineate migrating groundwater plume. Due to extensive historic migration of gasoline along a utility corridor, final corrective actions involved the purchase of adjacent properties to mitigate exposure and liability for the owner operator.

ENVIRONMENTAL SITE ASSESSMENTS

Performed Phase II Investigation in multiple states to address concerns raised by former use of property and potential impact from hazardous substances.

BASELINE ENVIRONMENTAL ASSESSMENTS

Have completed BEAs on vacant land, former retail gasoline stations, and industrial properties.
